# 1. About

A torque arm is an additional piece of metal which ensures that your axle is securely held in place.

It is designed for bikes with old forks (30+ years), carbon forks, or narrow forks. They add strength to your bike and keep your Swytch motor wheel in place.

## 2. Installation

- 1.1 Fit to the side opposite to the motor wire. Use the C-washers if needed to adjust spacing, depending on your fork dropout.
- 1.2 Tighten the jubilee clip on the axle.
- 1.3 Break off the excess clip by bending it back and forth.
